5.1.8. Database Design using Entity Relationship Model

This section Database Design using the Entity Relationship Model (ERM) outlines the structure of the Digital Portfolio System's database, defining key entities and their relationships. Primary entities include Pupils, Teachers, Assignments, Feedback, and Portfolios. Each entity is linked based on their interactions: for instance, Pupils are associated with Assignments and Feedback, while Teachers provide Feedback and track Student progress. Relationships in the ERM illustrate these connections, using primary and foreign keys to ensure data consistency and efficient retrieval. This structured design supports secure, scalable data management across the system.
